Summarizes progress since previous meeting

Made a lot of progress on the MVP
1. Authentication
2. User selecting their location
3. User selecting their availabilities (a robust widget for that)
4. Using location and availabilities to find matches and displaying that to them
5. Connecting two users
6. Allowing connections to be closed (and new connection found)
7. Connection history stored in DB
8. Progress on DB backend for storing notes (front end not started)

Identifies achieved and missed milestones
Missed:
Features not implemented include:
1. most HTML/CSS things (menu bar, styling for the dashboard)
2. Topics (storing, letting users choose, basing matchings on them) - though Kim made an attempt and learned a lot about what will need to happen for this based on the problems she encountered.
3. Journal (basic code written, but not tested)

Identifies difficulties encountered
1. Recovery from illnesses
2. Catching up on other work

Identifies changes to problem analysis or design
1. Need to discuss how to deal with interested users once a connection is closed (are they still interested? Do we wait some time before connecting two previously connected users? etc.)
